LEARNING DIARY, <FRONT-END 2020-21> MODULE

LEARNING DIARY

16.10.2020

I went through the course general information as well as course requirements. I checked the required environment of the course. As I used to study a little bit front-end before, I am familiar with version control thus I skip this part. I am also familiar with VS Code thus I choose this one as my code editor for this course.

I set up some extension of VS Code: Live Server that allows to open HTML on a dev server that has auto load; Bracket Pair Colorized which supports in matching colors of brackets, curly braces and parentheses; Prettier – Code formatter that automatically formats my code. I learnt the structure of the portfolio website, and setup the workflow of my portfolio website along with the video introduction.

I coded my landing page and main Sass.

I learnt how to use Sass.

I got the problem when running node sass. I did input the wrong path for scss file in the json file thus I couldn't run the node sass.

Another problem I did tackled is that in my portfolio website, I only included the nav on the right side.

I made my first git commit for the landing page and nav bar.

17.10.2020

I learnt more about Sass.

18.10.2020

I learnt media query and set media query for my portfolio website.

I made git commit.

I finished the website and deployed it by Github.

19.10.2020

I edited some minor problems and then pushed the final version of my portfolio to Github.
